CODE SECURITY ASSESSMENT

W E B 3 T O K E N U P

Overview

Project Summary

- Name: Web3 tokenup - Multisign contract
- Platform: EVM-compatible chains
- Language: Solidity
- Repository:
 - https://github.com/web3-tokenup/multisign_contract
- Audit Range: See [Appendix - 1](#)

Project Dashboard

Application Summary

Name	Web3 tokenup - Multisign contract
Version	v2
Type	Solidity
Dates	Oct 22 2025
Logs	Oct 21 2025; Oct 22 2025

Vulnerability Summary

Total High-Severity issues	0
Total Medium-Severity issues	0
Total Low-Severity issues	1
Total informational issues	0
Total	1

Contact

Risk Level Description

High Risk	The issue puts a large number of users' sensitive information at risk, or is reasonably likely to lead to catastrophic impact for clients' reputations or serious financial implications for clients and users.
Medium Risk	The issue puts a subset of users' sensitive information at risk, would be detrimental to the client's reputation if exploited, or is reasonably likely to lead to a moderate financial impact.
Low Risk	The risk is relatively small and could not be exploited on a recurring basis, or is a risk that the client has indicated is low impact in view of the client's business circumstances.
Informational	The issue does not pose an immediate risk, but is relevant to security best practices or defense in depth.

Introduction

1.1 About SALUS

At Salus Security, we are in the business of trust.

We are dedicated to tackling the toughest security challenges facing the industry today. By building foundational trust in technology and infrastructure through security, we help clients to lead their respective industries and unlock their full Web3 potential.

Our team of security experts employ industry-leading proof-of-concept (PoC) methodology for demonstrating smart contract vulnerabilities, coupled with advanced red teaming capabilities and a stereoscopic vulnerability detection service, to deliver comprehensive security assessments that allow clients to stay ahead of the curve.

In addition to smart contract audits and red teaming, our Rapid Detection Service for smart contracts aims to make security accessible to all. This high calibre, yet cost-efficient, security tool has been designed to support a wide range of business needs including investment due diligence, security and code quality assessments, and code optimisation.

We are reachable on Telegram (<https://t.me/salusec>), Twitter (https://twitter.com/salus_sec), or Email (support@salusec.io).

1.2 Audit Breakdown

The objective was to evaluate the repository for security-related issues, code quality, and adherence to specifications and best practices. Possible issues we looked for included (but are not limited to):

- Risky external calls
- Integer overflow/underflow
- Transaction-ordering dependence
- Timestamp dependence
- Access control
- Call stack limits and mishandled exceptions
- Number rounding errors
- Centralization of power
- Logical oversights and denial of service
- Business logic specification
- Code clones, functionality duplication

1.3 Disclaimer

Note that this security audit is not designed to replace functional tests required before any software release and does not give any warranties on finding all possible security issues with the given smart contract(s) or blockchain software, i.e., the evaluation result does not guarantee the nonexistence of any further findings of security issues.

Release Notes

Based on our review, the development of web3-tokenup multisign-contract is entirely based on the SAFE protocol, with no modifications made to the core logic. As a result, the security of the code also relies on that of the SAFE protocol. We encourage the team to regularly monitor the status of third-party dependencies to mitigate potential impacts in case they fail or become unreliable.

Module Path	Description (optional)	Original Source Link
safe-smart-account/contract s	Core logic of the smart account	Safe Smart Account V1.5.0

Findings

2.1 Summary of Findings

ID	Title	Severity	Category	Status
1	Third-party dependencies	Low	Dependency	Acknowledged

2.2 Notable Findings

Significant flaws that impact system confidentiality, integrity, or availability are listed below.

1. Third-party dependencies

Severity: Low

Category: Dependency

Target:

- All

Description

All contracts rely on the `safe-smart-account` protocol to enable the basic functionality. The current audit treats third-party entities as black boxes and assumes they are working correctly. However, in reality, third parties could be compromised, resulting in the disruption of token functionalities.

Recommendation

We understand that the business logic requires interaction with the third parties. We encourage the team to regularly monitor the statuses of third parties to reduce the impacts when they are not functioning properly.

Status

This issue has been acknowledged by the team.

2.3 Informational Findings

No informational issues were found.

Appendix

Appendix 1 - Files in Scope

This audit covered the following files in commit [c16ecc0](#).
